

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently amended) A door for at least partially covering a doorway defined by a wall and a lower surface, comprising:

a first door panel having a surface that faces the doorway and that is adapted to laterally translate relative to the doorway between a doorway blocking position and an unblocking position;

a first seal including a first sealing surface defining a plane and interposed between a first attachment end of the first seal and a first distal end of the first seal with the first attachment end of the first seal being attached to the first door panel [~~so a ray orthogonal to the plane intersects the surface of the first door panel~~]; and

a second seal disposed to allow relative movement between the first seal and the second seal, the second seal including a second sealing surface interposed between a second attachment end of the second seal and a second distal end of the second seal, such that the first door panel in the doorway blocking position causes the first sealing surface to contact the second sealing surface [~~and positions~~] so that 1) a ray orthogonal to the plane of the first sealing surface intersects the surface of the first door panel; and 2) the second distal end of the second seal is positioned between the first distal end of the first seal and at least one of the first door panel and the first attachment end of the first seal.

2. (previously presented) The door of claim 1, wherein at least one of the first sealing surface and the second sealing surface is tilted relative to the surface that faces the doorway.

3. (canceled)

4. (original) The door of claim 1, further comprising an actuation system coupled to the first door panel for laterally translating the first door panel relative to the doorway between the doorway blocking position and the unblocking position.

5. (original) The door of claim 4, wherein the actuation system includes an overhead track surface adapted to be mounted adjacent the doorway and being substantially linear and inclined with the first door panel being suspended therefrom.

6. (original) The door of claim 1, wherein the second seal is adapted to be substantially fixed relative to the doorway.

7. (original) The door of claim 1, wherein at least one of the first seal and the second seal is of a flexible material, so that with the first door panel in the doorway blocking position the first seal and the second seal stay in contact with each other even with some limited relative movement therebetween.

8. (original) The door of claim 7, wherein the first sealing surface engaging the second sealing surface creates a compressive force therebetween that in conjunction with the flexible material provides stored energy for enhanced sealing.

9. (original) The door of claim 1, wherein the first sealing surface engaging the second sealing surface creates a compressive force therebetween that helps align the first seal to the second seal.

10. (original) The door of claim 1, wherein the first seal comprises a first unitary piece of resilient foam and the second seal comprises a second unitary piece of resilient foam.

11. (original) The door of claim 1, wherein the first seal and the second seal have substantially similar cross-sectional profiles.

Claims 12-14 (canceled)

15. (Currently amended) A door for at least partially covering a doorway defined by a wall and a lower surface, comprising:

a first door panel having a surface that faces the doorway and that is adapted to laterally translate relative to the doorway between a doorway blocking position and an unblocking position;

a first seal carried with the first door panel and having a first sealing surface defining a plane and that faces the surface of the first door panel, [~~so that a ray orthogonal to the plane intersects the surface of the first door panel;~~] and

a second seal in sliding relationship with the first seal and having a second sealing surface contacting the first sealing surface when the first door panel is in the doorway blocking position so that a ray orthogonal to the plane of the first sealing surface intersects the surface of the first door panel.

Claims 16-27 (canceled)

28. (Currently amended) A door for at least partially covering a doorway defined by a wall and a lower surface, comprising:

a first door panel having a surface that faces the doorway and that is adapted to laterally translate relative to the doorway between a doorway blocking position and an unblocking position;

a first corner seal carried with the first door panel and having a first sealing surface defining a plane and ~~[arranged such that a ray orthogonal to the plane intersects the surface of the first door panel; and]~~

a second corner seal in sliding relationship with the first corner seal and having a second sealing surface that creates an L-shaped pattern of contact with the first sealing surface when the first door panel is in the doorway blocking position so that a ray orthogonal to the plane of the first sealing surface intersects the surface of the first door panel.

29. (original) The door of claim 28 further comprising:

a first seal including a first sealing surface interposed between a first attachment end and a first distal end with the first attachment end being attached to the first door panel; and

a second seal disposed to allow relative movement between the first seal and the second seal, the second seal including a second sealing surface interposed between a second attachment end and a second distal end, such that the first door panel in the blocking position causes the first sealing surface to face the second sealing surface and positions the second distal end between the first distal end and at least one of the first door panel and the first attachment end.
